3. Scenarios

Scenario 1: Exerciser Completing a Workout

Actor: Individual user (fitness enthusiast).

Goal: Perform a workout and record progress.

Context: User is at the gym and wants to focus on training without distractions.

The user logs into the app and sees workouts.

They choose the plan for chest workout.

User starts workout.

User does the first exercise (Bench press).

Takes rest.

Fill in reps - for first set.

Fill in reps - for second set.

User does second exercise (pec fly).

Takes rest.

Fill in reps - for first set.

Fill in reps - for second set. –add finished workout screen.

Finish workout.

Scenario 2: Trainer Assigning Workouts to Clients

Actor: Personal trainer.

Goal: Create, assign, and monitor workouts for clients.

Context: Trainer is preparing train plans for the client.

The user logs into the app.

Look for created workouts.

Name the workout.

Create new workout with 2 exercises:

Add exercise Leg press (add name exercise)

- 1 set - 450 kg, rest 4 minutes

- 2 set - 400 kg

Add exercise:

Squat

- 1 set - 150 kg, pause 4 minutes

- 2 set - 150 kg

Save workout.

Choose assigned client.

Assign created workout to user David

Save changes.

Return to home page

Scenario 3: User Reviewing Progress

Actor: Returning user.

Goal: Understand progress and adjust future training.

Context: User wants to see how their performance has evolved over time.

User log into system.

User wants to see workout history.

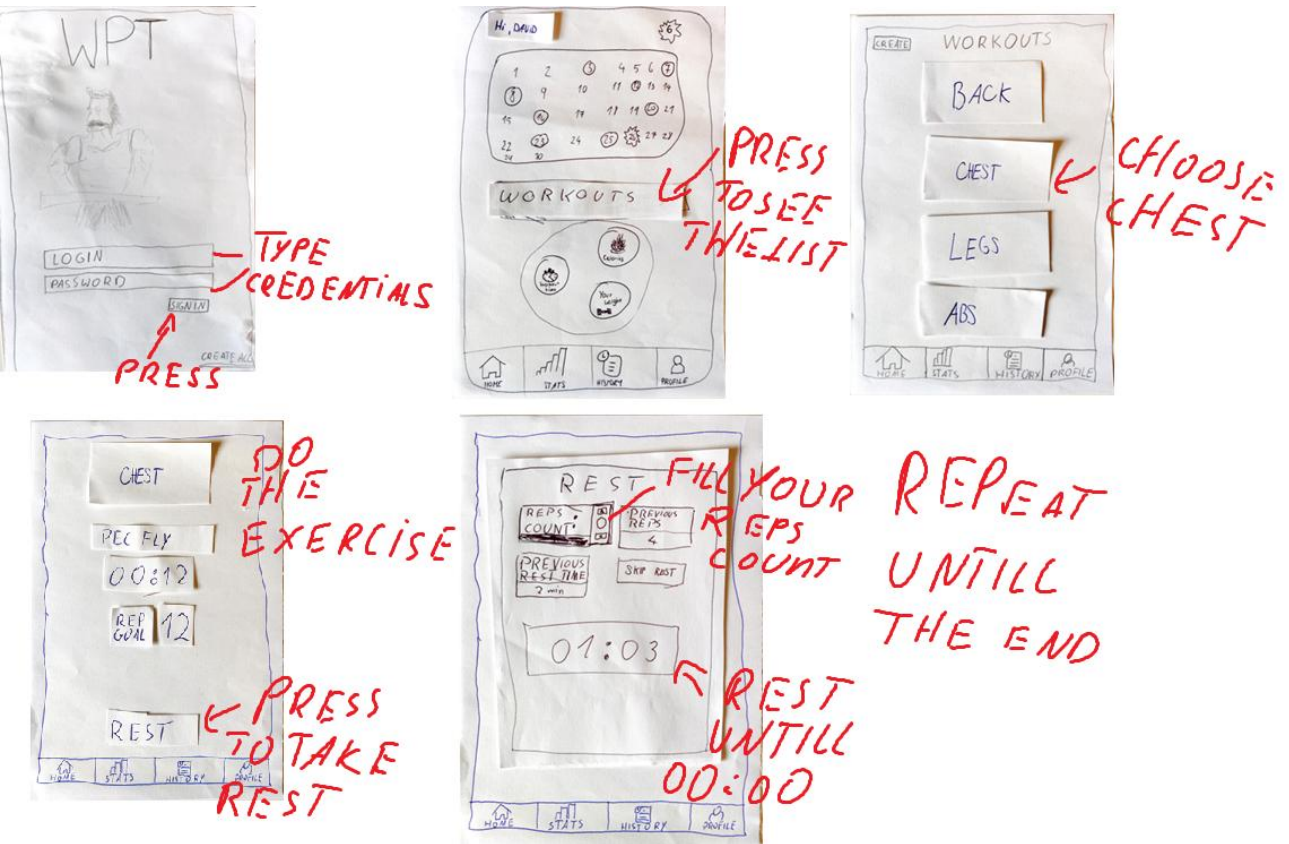

User chooses second last workout.

User review workout history - choose bench press for the more detail.

User review exercise history.

Return to home screen.

4. Storyboard for the 1st scenario

5. Briefing

This app helps users and trainers plan, track, and review workouts in an easy and organized way. It allows exercisers to log their sets, repetitions, and rest times in real time without distractions, while trainers can create and assign customized workouts to clients.

The main goal is to make training more structured and motivating by providing instant feedback and progress tracking. Users can review their performance over time through graphs and summaries, helping them understand improvements and adjust their routines.

Today, you'll use a paper prototype to explore how the app supports different workout-related tasks, such as completing a workout, assigning one as a trainer, or reviewing progress history.

6. Observations

Overall, most interactions with the prototype went smoothly, and users were able to complete the given scenarios without major issues. The design and flow of the interface were well understood, and users quickly adapted to the different screens.

Only a few minor adjustments were suggested during testing:

Some wording changes were proposed — for example, replacing “Customers” with “Clients” in certain scenarios for consistency and clarity.

Users recommended making the “Create Workout” button larger and more visually prominent to make it easier to notice on the home screen.

Apart from these small refinements, the interface and functionality were generally well received. Users found the layout intuitive, and the transitions between screens worked as expected. The prototype successfully supported all three planned scenarios: completing a workout, assigning workouts, and reviewing progress.
