Introduction

This report presents the heuristic evaluation of the Moodic interactive system interface, developed by Group 16. The evaluation was conducted in accordance with Stage 5 guidance , using the functional prototype hosted at: moodic-ipm.vercel.app.

Nº	Problem	Heuristic	Description	Severity (0-4)	Solution	Location
1	Reliance on Color Perception	Match between system and the real world	The "Colors" selection wheel relies entirely on visual color perception. Users with color blindness (e.g., Daltonism) may not distinguish between the red/green or blue/purple circles, making the interface unusable for them.	3 (Major)	Add text labels below the colored circles (e.g., "Red", "Blue") or icons representing the colors to ensure accessibility.	
2	Broken Responsive Layout	Consistency and standards (also Aesthetic and minimalist design)	When the browser window is narrowed (split screen), the interface fails to adapt. The "Colors" and "Emotions" groups collide and overlap, making the text illegible and the buttons difficult to distinguish or click accurately. This violates the standard expectation that websites function on	4 (Catastrophic)	Implement Responsive Design. Use CSS Media Queries to detect narrower screen widths. When the screen is small, change the layout direction from horizontal to vertical (stack the Color wheel <i>above</i> the Emotion wheel) so they do not touch.	

			different screen sizes.			
3	Inability to Collapse Sidebar	Flexibility and efficiency of use	The "Your Playlists" sidebar is permanently fixed and occupies roughly 25% of the screen width. There is no option (such as a hamburger menu or collapse arrow) to hide it or resize it. This forces users to sacrifice screen real estate even when they are not managing playlists, which exacerbates layout issues on smaller screens.	2 (Minor)	Add a toggle button (e.g., a "hamburger" icon or a chevron arrow <>) near the "Moodic" logo or the sidebar edge to allow users to collapse and expand the sidebar.	
4	Missing Time Indication (Music Player Bar)	Visibility of system status	The media player shows a visual progress bar (top line) but lacks numeric timestamps (e.g., "0:45 / 3:20"). Users cannot quickly determine the total length of the song or exactly how much time is remaining, which is a standard expectation for any media player.	3 (Major)	Add numeric labels for "Current Time" and "Total Duration" on the left and right sides of the progress bar respectively.	

Conclusion

In conclusion, the Moodic prototype offers a unique and visually engaging concept for music discovery. However, our heuristic evaluation identified a couple of usability issues that range in severity from minor cosmetic inconsistencies to catastrophic layout failures. Addressing the highlighted issues help Moodic better achieve its goal of establishing an emotional connection between the user and their music.

Date of receiving the project: 24th of November, 2025

Date of sending the report back to the group: 30th of November 2025
