

Assignment 1

Dawid Bogacz no. 75160

The following analysis examines two fundamentally different approaches to digital retail interfaces—the Brand-Focused design (Good) and the Discount/Merchandising-Focused design (Bad)—to illustrate the critical impact of User Experience (UX) principles on online shopping effectiveness.

Bad Interface – Example: Wish / AliExpress

Discount-oriented ecommerce platforms such as Wish and AliExpress are strong examples of poor interface design from a UX perspective, despite their commercial success. Their main focus is aggressive promotion and rapid conversion rather than user comfort or trust, which violates multiple Human-Computer Interaction (HCI) principles.

1. Visual Clutter and Cognitive Overload

The interface is overwhelmed by promotional elements competing for attention: flashing discount labels, countdown timers, badges, pop-ups and banners. Instead of guiding the user, the site creates **sensory overload**, which makes navigation frustrating and unprofessional.

- **High Signal-to-Noise Ratio:** The essential product information (image,

title, price, reviews) is buried under marketing noise, forcing users to manually search for what matters.

- **Inconsistent Visual Language:** Colors, fonts and element sizing vary widely, giving the impression of a low-quality and unreliable service.

2. Manipulative Persuasion Techniques

The design relies heavily on **dark patterns** that pressure users into rushed decisions:

- Constant countdown timers and phrases like “Only 2 left” simulate artificial urgency.
- Pop-ups offering rewards or temporary discounts interrupt browsing and limit user control.

Instead of supporting informed decisions, the site **prioritizes emotional triggers**, which feels deceptive and reduces long-term trust in the platform.

3. Poor Information Clarity

Prices are often displayed without formatting consistency (e.g., enormous discounts, crossed-out fake prices, unclear currency formatting).

This lack of transparency suggests unreliability and increases the perception of risk for the customer.

4. Weak Interactivity and Feedback

Navigation elements often change positions depending on context, and pages load unpredictably.

Users do not receive clear feedback when performing actions like adding to cart or opening product previews.

Summary:

Wish and AliExpress demonstrate how uncontrolled visual noise and manipulative urgency techniques damage trust and usability. Even if the design increases short-term sales, it sacrifices transparency and a positive user experience.

Good Interface – Example: Apple Store

The **Apple Online Store** represents an industry-leading example of excellent interface design. It prioritizes clarity, simplicity and brand identity, creating a premium and trustworthy experience from the first interaction.

1. Visual Simplicity and Focus on the Product

Apple follows the principle of **less but better** - the interface is built around large, high-quality visuals and minimalistic layout.

- **Low Cognitive Load:** Generous whitespace allows users to process information comfortably without distraction.
- **Consistent Aesthetics:** Colors, typography and spacing align with Apple's brand identity, reinforcing professionalism and trust.

2. Clear Visual Hierarchy and Navigation

Elements are intentionally structured to guide the user seamlessly toward the purchase action.

- A clearly visible **"Buy" / "Add to Bag"** button stands out using size and spacing rather than intrusive colors.
- Essential navigation elements (search bar, bag icon, menu) are predictably placed and remain consistent across devices.

3. Trust, Transparency and Information Flow

Apple uses **progressive disclosure** — instead of overwhelming the user, additional details appear only when requested (e.g., technical specifications, financing, delivery details).

- Professional, neutral language avoids pressure and urgency.
- Real-time feedback confirms every action, reinforcing reliability and

safety.

Summary:

Apple demonstrates how simplicity, consistency and respect for the user create comfort, trust and long-term loyalty. The interface feels professional, refined, and effortless to use.

Short Comparison Conclusion

While **Wish / AliExpress** maximize short-term conversion through aggressive visual marketing, **Apple** prioritizes clarity and trust, resulting in a significantly more enjoyable and reliable experience.

This shows that **good design is not about adding elements, but intentionally removing everything that distracts from the user's goal.**
