Introduction

This report includes a justified or fixed list of the problems identified in Stage 5 by Group 13.

Nº	Problem	Heuristic	Description	Severity (0-4)	Solution
1	Unclear Calendar Status & Feedback	Visibility of system status & Match between system and the real world	On the Home screen, the calendar displays dates with red and purple circles. There is no legend explaining what these colors signify. Furthermore, clicking on these dates provides no visual feedback or information, leaving the user confused about the system's state.	3	Add a clear legend explaining the color coding. Ensure that clicking a specific date provides feedback.
Solution: Adding a legend beneath the calendar will resolve any confusion about the meaning of highlighted dates. When a highlighted date is clicked, the workout details should be displayed.					

2	Lack of Confirmation for Data Entry	Visibility of system status	In the “Rest Info” / Exercise Review screen, the user inputs the “Reps Count”, but there is no “Confirm,” “Save”, or “Done” button specific to that input field. The user doesn’t know if the data was saved.	3	Add a visual confirmation mechanism (e.g., a “Check” icon or “Save” button) next to the input field, or display a “Saved” notification.
---	-------------------------------------	-----------------------------	---	---	---

Solution: The rep data will be saved automatically, so an additional button isn’t necessary. Adding one might confuse users. We believe users will quickly become familiar with this automatic saving process.

3	“Create Workout” Action Hard to Find	Consistency and standards	The “Create” option is located in the top-left corner as a small blue text link. Users expect primary actions (like creating a workout) to be prominent buttons or Floating Action Buttons.	2	Move the “Create” action to a more prominent location, such as a large button at the bottom of the list.
---	--------------------------------------	---------------------------	---	---	--

Solution: We can highlight the button for creating a workout; however, we don’t expect users to create workouts very often. For this reason, the button is placed separately from the list of existing workouts.

4	Missing “Assign Client” Feature	Match the real world	Scenario 2 explicitly asks the trainer to “Assign created workout to user David.” However, in the “Create Workout” flow, there is no field, dropdown, or option to select a client. This prevents the user from completing the specific task described in the scenario.	3	Add an “Assign to Client” dropdown menu within the “Create Workout” modal or add a specific step after saving the workout to select a user.
Solution: This feature is already implemented; however, to access it, the user must be signed in as a trainer, since only trainers can assign workouts to their clients.					

5	Inconsistent Navigation Controls	Consistency and Standards	The primary method for navigating back in the application is using the standard, consistent left arrow icon in the top-left corner (e.g., on the Workouts, Exercise, and Profile screens). However, on the History Detail screen, this standard icon is replaced by a small, text-based "Back" button. This break in internal consistency forces the user to pause and re-learn the navigation pattern on this single screen.	2	Replace the text-based "Back" button with the globally used left arrow icon to maintain consistency across all screens in the application.
---	----------------------------------	---------------------------	---	---	--

Solution: The solution proposed by Group 13 is correct. The design should be unified.

6	Ambiguous Data Visualization in Stats	Visibility of System Status Recognition Rather than Recall	The Stats screen displays a bar chart showing "Workouts this year.". The bars grow monthly but without any numerical scale, the user cannot accurately determine the quantity of workouts for any given month or the difference between months.	3	Add a numerical scale in increments of 5 or 10 so the user can quickly and accurately read the number of workouts per month. Implement tap/touch feedback on the bar chart that displays the exact numerical value (e.g., "18 Workouts") when a user selects a specific month's bar.
---	---------------------------------------	--	---	---	--

			The user must recall or guess the scale.		
Solution: A numeric scale has been added to the stats, along with a mouse-over feature that shows the exact number of workouts for a selected time period.					

Conclusion

Heuristic evaluation helped us identify bugs and errors in our application, and it also provided a different perspective on our system, highlighting several interesting points.
